### Abstract

A selective introduction of a fluorine atom into the  $\alpha$ -position of  $\beta$ -dicarbonyl compounds was achieved using *p*-iodotoluene difluoride. The reaction proceeded under mild conditions and monofluorination of  $\beta$ -ketoesters, ketoamides, and diketones selectively took place.

### Introduction

Direct substitution of  $\alpha$ -hydrogen of  $\beta$ -dicarbonyl compounds into a fluorine atom is a most efficient method for the synthesis of  $\alpha$ -fluoro- $\beta$ -dicarbonyl compounds which have been used as building blocks for the preparation of biologically active compounds containing a fluorine atom.<sup>1</sup> Elemental fluorine (F<sub>2</sub>)<sup>2</sup> or one of the many electrophilic fluorinating agents such as FClO<sub>3</sub>,<sup>3</sup> XeF<sub>2</sub>,<sup>4</sup> AcOF,<sup>5</sup> R<sub>f</sub>OF,<sup>6</sup> and CsSO<sub>4</sub>F<sup>7</sup> has been used for the fluorination of  $\beta$ -dicarbonyl compounds. However, most of these agents are highly aggressive, unstable and even explosive, and require special equipment and experience for safe handling. *N*-Fluorocompounds<sup>8</sup> have been developed as stable and effective fluorinating reagents of carbonyl compounds, but they need F<sub>2</sub> for their preparation and are expensive. We have studied the fluorination of organic compounds using *p*-iodotoluene difluoride (**1**)<sup>9</sup> which is not only easy to handle, but also accessible without hazardous F<sub>2</sub> and harmful Hg salts.<sup>10</sup> Recently, we succeeded in the selective fluorination of  $\beta$ -ketoesters (**2**) using **1** and an HF-amine complex.<sup>11</sup> Though **1** is a stable and safe compound, HF-amine complexes are hazardous. Therefore, we continued to investigate the fluorination reaction of  $\beta$ -carbonyl compounds using **1** to find a more convenient method, and we found the fluorination of  $\beta$ -dicarbonyl compounds using **1** without the addition of the HF-amine complexes (**Scheme 1**).

<sup>a</sup> Isolation yields based on substrate used.

The fluorination of  $\beta$ -dicarbonyl compounds under neutral conditions is slow compared with that under acidic conditions. When the fluorination of ketoesters **2** using **1** was carried out in the presence of pyridine-9HF, the reaction was completed at room temperature in a few hours.<sup>11</sup> On the other hand, under neutral conditions, the reaction of pentyl acetoacetate (**2a**) with **1** was sluggish at room temperature and only a trace of the fluorinated product (**5a**) was formed after 12 h. When the reaction was carried out at 40 °C in CH<sub>2</sub>Cl<sub>2</sub>, **2a** was consumed in 10 h and **5a** was obtained in 65% yield (Entry 1 in Table 1). Under the similar reaction conditions, various  $\beta$ -ketoesters (**2a-d**) were selectively monofluorinated, and difluoro products were not formed at all (Entries 1-4 in Table 1). The fluorination of  $\beta$ -ketoamides (**3a-c**) using **1** was also possible under neutral conditions, and monofluorinated products (**6a-c**) were obtained in good yield (Entries 5-7).

<sup>a</sup> Isolation yields based on **4** used and in parentheses, NMR yield.

<sup>b</sup> 1 eq. of pyridine-9HF was added.

The fluorination reaction of  $\beta$ -diketones (**4**) was also examined. In the presence of the amine-HF complex, the reaction of  $\beta$ -diketones (**4a,b**) with **1** gave the desired monofluoro products (**7a,b**) in moderate yields with unidentifiable by-products (Entries 2 and 4 in Table 2). In the reaction of **4a** with **1** under the neutral condition, the longer reaction time was required to consume **4a** but the monofluoro product **7a** could be obtained in good yield (Entry 1). Under similar conditions,  $\alpha$ -unsubstituted  $\beta$ -diketones (**4b-d**) gave  $\alpha$ -fluoro- $\beta$ -diketones (**7b-d**) in good yield as shown in Table 2.

## Experimental Section

**General Procedures.** IR spectra were recorded using a JASCO FT/IR-410. <sup>1</sup>H and <sup>19</sup>F NMR spectra were recorded in CDCl<sub>3</sub> on a JEOL JNM-A400 II FT NMR and chemical shifts,  $\delta$ , are referred to TMS (<sup>1</sup>H) and CFC1<sub>3</sub> (<sup>19</sup>F) respectively. High-resolution mass spectra were taken at the Center for Instrumental Analysis, Hokkaido University. silica gel 60N of Kanto Chemical Co., Inc. was used for column chromatography and Merck Silica gel 60 F<sub>254</sub> was used for TLC analysis. **1** was prepared from iodotoluene as reported before.<sup>10</sup> Ketoesters **2a-c**, ketoamide **3a**, and diketones **4a-b** were purchased from Tokyo Kasei Kogyo Co., Ltd. and used without purification. Pyridine-9HF was prepared from anhydrous HF and pyridine according to the literature.<sup>12</sup> Ketoamides **3b-c** were prepared from diketene and the corresponding amines according to the literature.<sup>13</sup> Ketoester **2d**<sup>14</sup> and diketones **4c, d**<sup>15</sup> were prepared according to the literature.

### General procedure for the synthesis of $\alpha$ -fluoro- $\beta$ -ketoesters (**5a-d**)

A CH<sub>2</sub>Cl<sub>2</sub> solution (5 ml) of **2a-d** (1 mmol) and **1** (282 mg, 1.1 mmol) in a Teflon<sup>®</sup> vessel with a screw-cap was stirred at 40 °C. After the reaction, the mixture was poured into 20 ml of aqueous NaHCO<sub>3</sub> and extracted with ether (20 ml x 3). The combined organic layers were dried over MgSO<sub>4</sub>, concentrated under reduced pressure. Purification by column chromatography (silica gel/hexane-ether) gave **5a-d**.
