## Abstract

1-Acylthiosemicarbazides **1a-d** reacted with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (**2a**), 2,3,5,6-tetrachloro-1,4-benzoquinone (**2b**), 2,3-dichloro-1,4-naphthoquinone (**3a**) and 2,3-dicyano-1,4-naphthoquinone (**3b**) in ethyl acetate with admission of air to form benzo- and naphtho-imidazoxadiazoles (**5**, **6**, **11**), naphthobisthiazoles (**12a-d**), naphthothiadiazines (**13a-d**) as well as 2,3,7,8-tetrachlorothianthrene-1,4,6,9-tetraone (**7**). Rationales for the observed conversions are presented.

**Keywords:** Benzo- and naphthoquinones, Cyclocondensation, Fused heterocyclic compounds

---

## Introduction

The chemistry of quinones is of considerable interest since this class of compounds includes many natural products and numerous important synthetic products<sup>1,2</sup>. Addition of nitrogen nucleophiles to benzo- and naphthoquinones represents a common synthetic route to many fused heterocyclic rings which have been used as synthetic intermediates in medicinal chemistry<sup>3-6</sup> and for dyestuffs<sup>7-16</sup>.

2,3,5,6-Tetrachloro-1,4-benzoquinone (**2b**) and 2,3-dichloro-1,4-naphthoquinone (**3a**) reacted with *N,N*<sup>2</sup>-diarylamidines to give benzimidazole and indole derivatives<sup>17,18</sup>. A series of benzo- and naphthothiazole derivatives have been synthesized by reaction of *N*-substituted thioureas with **2a**, **2b** and **3a**<sup>19</sup>. Indazole, thiadiazine and naphthothiadiazine derivatives were isolated from the reaction of thiosemicarbazide with **2b** and **3a**<sup>10</sup>. The reaction of *N,N*<sup>1</sup>-disubstituted hydrazinecarbothioamides with **2b** and **3a** afforded thiadiazole and thiadiazine derivatives<sup>20</sup>. In contrast, quinoxaline and thiadiazepane derivatives were obtained from the reaction of substituted thioureidoethylthioureas with **2b**<sup>20</sup>.

Recently, we have reported that 4-substituted thiosemicarbazides reacted with **2a**, **2b** and **3a** in ethyl acetate with admission of air to form derivatives of 1,5,2,3-oxathiadiazole, indazole, thiadiazine-6-one, 1,3,4-thiadiazaphenanthrenone and naphtho[1,2-*e*:4,3-*e'*]bis[1,3,4]-

thiadiazine<sup>21</sup>. This unique reactivity has no precedence and warrants further investigation. Therefore, we undertook to prepare electron poorer examples such as 1-acylthiosemicarbazides **1a-d**, and to investigate their behaviour towards benzo- as well as naphthoquinones **2a,b** and **3a,b** (Fig. 1).

**Figure 1**

## Results and Discussion

Mixing of two-fold molar amounts of **2a** with one mole each of the donors **1a-d** in ethyl acetate with admission of air gives a blue colour ( $\lambda_{\text{max}} = 573\text{-}591$  nm). This colour changes gradually to brown with the formation of a solid product. This behaviour is explained as being due to initial formation of an unstable charge-transfer complex (CTC) followed by a chemical reaction which yields substituted benzimidazoxadiazole **5a-d** via the reaction of dihydrobenzoquinone (**2a-H<sub>2</sub>**) with **4** and elimination one molecule of HCN and another of H<sub>2</sub>O (Scheme 1). The structures of the well known compounds **4a-c** were confirmed on the basis of spectral data and mixed melting points. The structural assignments for the benzimidazoxadiazole derivatives **5a-d** are based on the following spectral data: the IR spectrum of **5a** showed characteristic absorption for the hydroxyl group at  $\nu$  3440  $\text{cm}^{-1}$  and at 2220  $\text{cm}^{-1}$  for the cyano group. The <sup>1</sup>H-NMR spectrum showed a broad signal at 9.53 ppm due to the OH in addition to the methyl group at 2.33 ppm. The decoupled <sup>13</sup>C-NMR spectrum showed signals at  $\delta$  164.82, 156.22 and 150.71 for C-2, C-9a and C-8a, respectively. Also, the <sup>13</sup>C-NMR clearly indicates the presence of one cyano group at 118.77 ppm beside the aromatic carbons.

The molecular formulae for **5a-d** (Scheme 1) are supported by elemental analyses and mass spectra, which gave the expected molecular ion peaks. The semi-micropreparative scale reaction of **1a** with **2a** gave **5a**, as established from the comparison of its IR spectrum and mp with those

of an authentic sample. In addition, small quantities of numerous coloured, unidentifiable byproducts were observed.

### Scheme 1

On the other hand, mixing of a two fold molar excess of **2b** with one mole of 1-acylthiosemicarbazides **1a-d** leads to the formation of an initial CTC ( $\lambda_{\text{max}} = 506\text{-}518 \text{ nm}$ ) followed by formation (complete after three days) of the products, benzimidazoxadiazoliones **6a-d**, oxadiazoles **4a-d** and 2,3,7,8-tetrachlorothianthrene-1,4,6,9-tetraone **7** (Scheme 2).

R	CH <sub>3</sub>	C <sub>6</sub> H <sub>5</sub>	4-HO-C <sub>6</sub> H <sub>4</sub>	4-Br-C <sub>6</sub> H <sub>4</sub> -CH <sub>2</sub>

### Scheme 2

The IR spectrum of **6b** showed a sharp band at  $1695 \text{ cm}^{-1}$  for the carbonyl group of the quinone system. The <sup>1</sup>H-NMR spectrum revealed a multiplet at 7.19-7.66 ppm, which is characteristic of phenyl protons. The <sup>13</sup>C-NMR spectrum showed the characteristic absorption signals of the carbonyl carbon atoms of **2b** at 170.72 and 171.83<sup>22</sup>. Other signals were observed in the <sup>13</sup>C-NMR of **6b**, clearly indicating the presence of C=N, N=C-O, Cl-C=C=Cl groups

(experimental part). The formation of **6b** was further confirmed by mass spectrometry. Besides the molecular ion at 331/335, the characteristic fragment ion patterns of substituted dichloro compounds were observed<sup>23</sup>.

### Scheme 3

Formation of products **4**, **6** and **7** may be rationalized by the mechanism shown in Scheme 3. An unstable CTC is formed followed by the formation of radical **1<sup>•+</sup>** and **2b<sup>•-</sup>**.

Two routes can be suggested for the formation of compounds **4**, **6** and **7**. The first one is the cyclization of **1a-d** and formation of the oxadiazoles **4a-d** during intramolecular nucleophilic attacks on the thiocarbonyl group. After cyclization, **2b** is released with the liberation of H<sub>2</sub>S (Scheme 3). Recombination of **4** and **2b** with elimination of two molecules of HCl would afford

the benzimidazoxodiazoleiones **6a-d**. The second possible route is the elimination of one molecule of HCl from (**1** + **2b-H**) to give the intermediate **9**. Nucleophilic attack by the OH group on C=N and detachment of the HS-moiety would afford the intermediate **10** along with oxadiazoles **4a-d**. Then, the tetrachlorothianthrenetetrone **7** could be formed *via* the reaction of two molecules of **10** with the elimination of two molecules of HCl (Scheme 3).

#### Scheme 4

By mixing equimolar amounts of 1-acylthiosemicarbazides **1a-d** and **3a** in ethyl acetate the colour of the reaction mixture remains unchanged. Obviously, there is no donor-acceptor interaction between these two molecules, which is mainly due to the low electron affinity of **3a** compared with **2b**<sup>24</sup>. Heating of this mixture for 5 hours and chromatographic separation of the residue after concentration gave numerous coloured zones, from which naphthoimidazodiazoles **11a-d** and naphthobisthiazoles **12a-d** could be isolated (Scheme 4).

The structures of **11a-d** were delineated from their spectroscopic properties and gross compositions. The major products **12a-d** were found to be formed from one molecule of **3a-H<sub>2</sub>** and two molecules of **1a-d** by loss of two molecules of H<sub>2</sub>O and HCl.

The IR spectrum of **12d** showed absorption characteristic of NH groups at 3385, 3225 cm<sup>-1</sup> and a strong carbonyl group absorption at 1670 cm<sup>-1</sup>. The <sup>1</sup>H-NMR spectrum of **12d** clearly indicates the presence of two different broad signals centered at 10.65 and 11.17 ppm due to thiazole-NH and amide-NH, respectively. In addition, the benzylic-CH<sub>2</sub> as well as aromatic protons were observed (see experimental part). The <sup>13</sup>C-NMR of **12d** showed a carbonyl signal at δ<sub>C</sub> = 171.48 corresponding to the amide group. Also, the <sup>13</sup>C-NMR clearly indicates the presence of signals at 52.28 and 163.26 due to benzylic-CH<sub>2</sub> and thiazole-C<sub>2</sub>, respectively. The elemental analysis of **12d** suggested a gross formula C<sub>28</sub>H<sub>20</sub>Br<sub>2</sub>N<sub>6</sub>O<sub>2</sub>S<sub>2</sub> and this was confirmed by the mass spectrum, which exhibited the molecular ion at m/z 698/694 (17 %). It should be noted also that the mass spectra of compounds **12a-d** show the loss of an acyl group from the molecular ions.

In contrast to the situation with **3a**, on addition of **1a-d** to **3b**, the initial formation of CT complexes ( $\lambda_{\text{max}} = 523\text{-}532\text{ nm}$ ) is followed by the formation of naphthothiazine derivatives **13a-d** in addition to oxadiazoles **4a-d** (Scheme 5).

<b>1, 4, 13</b>	<b>a</b>	<b>b</b>	<b>c</b>	<b>d</b>
R	CH <sub>3</sub>	C <sub>6</sub> H <sub>5</sub>	4-HO-C <sub>6</sub> H <sub>4</sub>	4-Br-C <sub>6</sub> H <sub>4</sub> -CH <sub>2</sub>

### Scheme 5

For compound **13b**, the gross formula C<sub>20</sub>H<sub>13</sub>N<sub>5</sub>O<sub>2</sub>S is supported by mass spectroscopy, which clearly demonstrates the loss of a benzoyl group. The <sup>13</sup>C NMR spectrum reveals the absence of the C=S signal and the presence of an amide C=O signal (171.56) and only one CN resonance (118.11 ppm). In addition to an OH group, both a NH<sub>2</sub> ( $\delta_{\text{H}} = 7.12\text{ ppm}$ ) and a low field amide-NH ( $\delta_{\text{H}} = 11.15\text{ ppm}$ ) are present. The IR spectrum of **13b** showed bands at 3445, 3370-3250, 2220 and 1675 cm<sup>-1</sup> due to OH, (NH and NH<sub>2</sub>), CN and amide C=O groups, respectively.

### Conclusions

Novel and interesting structures are presented here from the reactions between the electron donor 1-acylthiosemicarbazides **1a-d** and electron acceptors; benzo- as well as naphthoquinones **2a,b** and **3a,b**. In a fairly complex, multistep process, three interesting kinds of fused heterocyclic compounds (benzo- and naphthoimidoxadiazoles, naphthobisthiazole and naphthothiazine derivatives) are formed, in addition to the oxadiazole ring. Thus, benzo- and naphthoquinones may act either as mediators or as building blocks in heterocyclization of acylthiosemicarbazides. The results reported also supplement the chemistry of nucleophilic substitution of halogenated *p*-quinones, which continues to be of interest for the synthesis of many heterocycles.

## Experimental Section

**General Procedures:** The uncorrected melting points were determined on a Gallenkamp melting point apparatus, IR spectra were recorded using KBr disks on Shimadzu 408 or Bruker Vector 22 FT-IR instruments.  $^1\text{H}$  300 MHz and  $^{13}\text{C}$ -NMR 75 MHz spectra were recorded on a Bruker WM300 instrument, 500 MHz  $^1\text{H}$  and 125 MHz  $^{13}\text{C}$ -NMR spectra on a Bruker DRX 500 spectrometer. Chemical shifts are expressed as  $\delta$  [ppm] with reference to tetramethylsilane as an internal standard, s = singlet, d = doublet, m = multiplet. The  $^{13}\text{C}$  signals were assigned on the basis of DEPT 135/90 spectra. The mass spectra (70 eV, electron impact mode) were recorded on an AMD 604 instrument. The UV-VIS spectra were recorded on a Perkin-Elmer Lambda 2 spectrophotometer. Combustion analysis was carried out at the Microanalytical center, Cairo University, Egypt. Preparative layer chromatography (plc) was carried out using air dried 1.0 mm thick layers of a slurry of silica gel (Merck PF<sub>254</sub>) applied on 48 cm wide and 20 cm high glass plates using cyclohexane/ ethyl acetate as developing solvent. Zones were detected by their colour or by quenching of indicator fluorescence upon exposure to 254 nm light and extracted out with acetone.

**Materials:** 1-Acylthiosemicarbazides **1a-c** were prepared according to the literature<sup>25-27</sup>. The  $^1\text{H}$ -NMR spectral data of 1-acetylthiosemicarbazide (**1a**)<sup>25</sup>, 1-benzoylthiosemicarbazide (**1b**)<sup>26</sup>, and 1-(4-hydroxyphenyl)thiosemicarbazide (**1c**)<sup>27</sup> were in full accord with the published data.

**1-(4-Bromophenylaceto)thiosemicarbazide (1d).** To a stirred solution of thiosemicarbazide (0.91 g, 10 mmol) in 50 ml dry acetone, *p*-bromophenylacetic acid (2.15 g, 10 mmol) was added and the mixture was refluxed for 3 hours. A white precipitate was formed and recrystallized from ethanol to give colourless crystals (2.84 g, 85 %), mp = 96-98 °C.

2,3-Dichloro-5,6-dicyano-1,4-benzoquinone (**2a**, Aldrich) was recrystallized from benzene/chloroform (2:3). 2,3,5,6-Tetrachloro-1,4-benzoquinone (**2b**, Aldrich) was recrystallized from benzene before use. 2,3-Dicyano-1,4-naphthoquinone (**3b**) was prepared from 2,3-dichloro-1,4-naphthoquinone (**3a**) according to Badni<sup>28</sup> and recrystallized from dichloromethane.

### Reaction of 1-acylthiosemicarbazides **1a-d** with **2a**

To a solution of 454 mg of **2a** (2 mmoles) in 20 ml of dry ethyl acetate, were added the acylthiosemicarbazides **1a-d** (1 mmol) in 15 ml of dry ethyl acetate dropwise with stirring at room temperature. Thereafter, the mixture was stirred for 24 h, filtered, and the precipitate was washed with a small amount of cold ethyl acetate. The filtrate was concentrated and the residue chromatographed on thin-layer plates (silica gel Pf<sub>254</sub>) using cyclohexane/ethyl acetate (5:1) to give only one zone containing the oxadiazole derivatives **4a-d**. Recrystallization of the isolated products from suitable solvents afforded the pure compounds **4a-d** and **5a-d**.

**Reaction of 1-acylthiosemicarbazides 1a-d with 2b**

To a stirred solution of 492 mg (2 mmols) of **2b** in 30 ml of dry ethyl acetate, were added acylthiosemicarbazides **1a-d** (1 mmol) in 15 ml dry ethyl acetate dropwise at room temperature. The colour of the reaction mixture changed gradually from reddish brown to pale blue. The mixture was stirred for another 72 h and then filtered off. The blue precipitate which contained compound **7**<sup>20</sup> was washed with cold ethyl acetate. The filtrate was concentrated and the residue was then separated by preparative layer chromatography (plc) using a suitable eluent (cyclohexane/ ethyl acetate, 5:1 for the reaction of **2b** with **1a** and **1d**; 3:1 for the reaction of **2b** with **1b** and **1c**) to give numerous coloured zones, two of which (with high intensity) were removed and extracted. The faster migrating one,  $R_f = 0.146$ , contained the oxadiazoles **4a-d**, and the second zone,  $R_f = 0.096$  (characterized by its green colour) contained benzimidazoxadiazole-diones **6a-d**. Extraction of the zones with acetone, and concentration, gave a residue which was rechromatographed to separate the pure compounds.

**2-Methyl-6,7-dichloro-benzo[4,5]imidazo[2,1-b][1,3,4]oxadiazole-5,8-dione (6a).** Pale green crystals (171 mg, 63 %), mp 190-192 °C (ethanol). IR (KBr):  $\nu$  2960 (Ali-CH), 1690 (C=O), 1620 (C=N), 1086 (C-O-C)  $\text{cm}^{-1}$ . <sup>1</sup>H-NMR (DMSO-d<sub>6</sub>):  $\delta$  2.36 (s, 3H, CH<sub>3</sub>). <sup>13</sup>C-NMR (DMSO-d<sub>6</sub>):  $\delta$  15.83 (CH<sub>3</sub>), 142.12 (C-6, C-7), 150.84, 150.93 (C-4a, C-8a), 154.12 (C-9a), 164.87 (C-2), 170.66, 171.76 (C-5, C-8). MS m/z (%): 273/269 (M<sup>+</sup>, 27), 228 (31), 157 (24), 129 (18), 101 (32), 43 (100). Anal. ### Reaction of 1-acylthiosemicarbazides **1a-d** with **3a**

A mixture of equimolar amounts of the appropriate 1-acylthiosemicarbazide **1a-d** and **3a** was stirred under reflux in 30 ml of dry ethyl acetate for 3 hours. The mixture was concentrated under vacuum and the residue separated by plc using cyclohexane / ethyl acetate (1:1) as developing solvent to give numerous coloured zones, two of which (with the highest intensity) were extracted and removed. The fastest migrating one  $R_f = 0.192$  contained naphthimidazoxadiazole **11a-d**, the second zone  $R_f = 0.144$  (which was always characterized by a blue colour) contained the naphthobisthiazole derivatives **12a-d**. Extraction of the zones with acetone, and concentration gave a residue, which was rechromatographed to separate the pure compounds.

**Reaction of 1-acylthiosemicarbazides 1a-d with (3b)**

A solution of **1a-d** (1 mmol) in 20 ml of dry ethyl acetate is added dropwise to solution of **3b** (1 mmol) in 10 ml of dry ethyl acetate at room temperature. The reaction mixture becomes green and gradually turns into a reddish brown colour. It was left standing for 48 hours, concentrated *in vacuo* and the residue was subjected to plc using cyclohexane/ethyl acetate (2:1) to give numerous coloured zones, the two intense of which were removed and extracted. The fastest migrating zone which quenched all indicator fluorescence upon exposure to 254 nm UV-light contained oxadiazole derivatives **4a-d** and the slowest migrating zone (which is always characterized by orange colour) contained the naphthothiazine derivatives **13a-d**. Extraction of the zones with acetone and recrystallization afforded the reaction products.

**(4-Amino-5-cyano-6-hydroxy-2H-naphtho[2,1-e][1,3]thiazine-2-ylidene)-2-(4-bromophenyl)acetohydrazide (13d)**

Orange crystals (312 mg, 65 %), mp 248-250 °C (methanol). IR (KBr):  $\nu$  3430, 3380-3260 (OH, NH, NH<sub>2</sub>), 2220 (CN), 1675 (C=O), 1615 (C=N), 1590 (aryl) cm<sup>-1</sup>. <sup>1</sup>H-NMR (DMSO-d<sub>6</sub>):  $\delta$  4.26 (s, 2H, CH<sub>2</sub>), 7.05-7.78 (m, 10H, NH<sub>2</sub> and aryl), 9.65 (br, 1H, OH), 11.16 (br, 1H, amide-NH). <sup>13</sup>C-NMR (DMSO-d<sub>6</sub>):  $\delta$  52.61 (CH<sub>2</sub>), 126.94, 127.73, 128.26,

129.85, 130.12, 130.63 (aryl-CH), 131.22, 132.36, 134.75 (aryl-C), 153.58 (C-6), 154.68 (C-2), 156.76 (C-4), 171.48 (amide-CO). MS m/z (%): 481/479 ( $M^+$ , 27), 400 (12), 282 (19), 254 (6), 228 (7), 198 (28), 118 (68), 77 (100), 65 (74). Anal. Calcd. for  $C_{21}H_{14}BrN_5O_2S$ : C, 52.51; H, 2.94; N, 14.58; S, 6.68. Found: C, 52.24; H, 3.98; N, 14.76; S, 6.41.

## Acknowledgements

A. A. Hassan is indebted to the A. v. Humboldt- Foundation for the donation of the Shimadzu 408 IR spectrophotometer.
