### Abstract

New exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones have been synthesized by the base-catalyzed reaction of chromanone, flavanone, their 1-thio analogues and *trans*-cinnamaldehydes. These unsaturated ketones were reacted with diazomethane at ca. 4 °C to afford spiro-1-pyrazolines in regioselective and stereospecific reaction. Structure and stereochemistry of all these new compounds have been elucidated by combined utilization of various spectroscopic, mainly NMR techniques.

**Keywords:** 3-Cinnamylidenechromanones, 3-cinnamylidene-1-thiochromanones, spiro-1-pyrazolines, one- and two-dimensional NMR

---

### Introduction

Reaction of  $\alpha,\beta$ -enones with diazomethane is a simple versatile procedure for the preparation of a wide variety of 1-pyrazolines as primary products which spontaneously isomerise or can be converted into the appropriate 2-pyrazoline isomers.<sup>1</sup> Chalcones and related  $\alpha,\beta$ -unsaturated ketones are especially useful starting materials for the synthesis of 2-pyrazolines by this method.<sup>2</sup> Synthesis of spiro-1-pyrazolines by the 1,3-dipolar cycloaddition reaction of exocyclic  $\alpha,\beta$ -unsaturated ketones and diazomethane has been achieved in several research laboratories.<sup>3</sup> These

studies proved that this 1,3-dipolar cycloaddition is stereospecific providing stereohomogeneous spiro-1-pyrazolines as stable pyrazoline isomers.

$\alpha,\beta,\gamma,\delta$ -Unsaturated ketones have been used as starting materials for the synthesis of styryl-2-pyrazolines.<sup>4</sup> Previously we have investigated the reaction of  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones and diazomethane.<sup>5</sup> This 1,3-dipolar cycloaddition reaction of (*E,E*)-cinnamylideneacetophenones was found to be regioselective affording 3-benzoyl-4-styryl-2-pyrazolines. As a continuation of our previous studies on the reaction of exocyclic  $\alpha,\beta$ -unsaturated ketones<sup>3e,f,i,j</sup> and (*E,E*)-cinnamylideneacetophenones<sup>5</sup> with diazomethane, in our present paper this 1,3-dipolar cycloaddition reaction of exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones derived from chromanone, flavanone and their 1-thio analogues and diazomethane is reported.

## Results and Discussion

Exocyclic  $\alpha,\beta$ -unsaturated ketones are well known compounds.<sup>6</sup> However, the related exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones have hitherto been scarcely mentioned in the chemical literature. Synthesis of a few representatives of 2-cinnamylidene-1-indanones, -1-tetralones and -1-benzosuberones was described in several papers.<sup>7</sup> Since our aim was to study the 1,3-dipolar cycloaddition reaction of 3-cinnamylidenechromanones, -flavanones and their 1-thio analogues with diazomethane, first we needed to synthesize these previously unknown starting materials. We were going to investigate the influence of various structural elements of the starting exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones, *viz.* the heteroatom in the cyclic ketone moiety of the molecule, a substituent present in the vicinity of the  $\gamma,\delta$ -double bond.

Chromanone (**1**), 1-thiochromanone (**2**), flavanone (**3**) and 1-thioflavanone (**4**) were allowed to react with *trans*-cinnamaldehydes (**5-7**) to afford the appropriate exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones **8-15** (Scheme 1) in good yields (68-83%). Structure and stereochemistry of these new compounds have been elucidated by IR, mass and NMR spectroscopic measurements (*cf.* Experimental).

The value of the  $^3J(\text{H-}\gamma,\text{H-}\delta)$  coupling (~15 Hz) reveals the (*E*) relative configuration of the double bond between C- $\gamma$  and C- $\delta$  atoms. Considering the value of the  $^3J(\text{H-}\beta,\text{H-}\gamma)$  coupling (~12 Hz) we can conclude the antiperiplanar arrangement of these hydrogen atoms in the preferred conformation. Due to the strong deshielding effect of the C=O group the chemical shift of H- $\beta$  in *peri* position is ca. 0.5 ppm higher comparing to H- $\gamma$  and H- $\delta$ . This observation and the detected H- $\beta$ /H- $\delta$  and H-2/H- $\gamma$  NOESY sterical proximities elucidate the (*Z*) arrangement of H- $\beta$  and C-4 which corresponds to the (*E*) relative configuration of the exo-double bond (C-3=C- $\beta$ ) in compound where X = O but in the case of X = S compounds the same arrangement corresponds to the (*Z*) relative configuration.

## Scheme 1

The 1,3-dipolar cycloaddition of diazomethane to (*E*)- and (*Z*)-isomers of exocyclic  $\alpha,\beta$ -unsaturated ketones was found to be regioselective and stereospecific providing spiro-1-pyrazolines<sup>2</sup>. The methylene moiety of the diazomethane was connected to the  $\beta$ -carbon atom of the  $\alpha,\beta$ -enone and the stereochemistry of the starting  $\alpha,\beta$ -unsaturated ketone was retained in each case. Reaction of (*E,E*)-cinnamylideneacetophenones and diazomethane have been found to be regioselective as well affording 3-benzoyl-4-styryl-2-pyrazolines as sole isolable products<sup>5</sup>. All these results prompted us to investigate this chemical transformation of our above-mentioned new exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones **8-15**.

## Scheme 2

Compounds **8-15** and diazomethane were allowed to react in a mixture of anhydrous diethyl ether and methylene chloride at *ca.* 4 °C to obtain *trans*-spiro-1-pyrazolines **16-23** in good yields (71-86%) (Scheme 2). The structure and stereochemistry of pyrazolines prepared have been elucidated by a combined utilization of various spectroscopic methods.

The cycloaddition of diazomethane on the C-3=C- $\beta$  exo double bond results in the formation of two new stereogenic centres (C-3, C-4') in compounds **16-23**. The reactions gave racemates but for the sake of clarity, only one enantiomer with N-2' in „ $\alpha$ ” position is discussed. In the case of compounds X = O the configuration of C-3 is *S* whereas *R* when X = S. In this respect the configuration at C-4' and C-2 (in the case of 2-phenyl substitution) for the products **16-23** should be elucidated.

In accordance with the results of PM3 semiempirical calculations (Hyperchem 7)<sup>8</sup> due to the ring strain caused by the N=N bond the pyrazoline ring is nearly planar. The condensed six-membered heterocyclic ring exists in an equilibrium of two half-chair conformers. In conformer “A” N-2' atom takes the quasi-equatorial, whereas in conformer “B” the quasi-axial position (Figure 1).

**Figure 1.** Stereostructure (Hyperchem 7, semiempirical, PM3)<sup>8</sup> of compound **16**. The reactions yielded racemates but for the sake of clarity only one enantiomer with N-2' in „ $\alpha$ ” position is shown.

In the NOESY spectra we observed strong H- $\gamma$ /H<sub>2</sub>-2 correlations. Such type of steric proximities is possible only in the isomer shown in Figure 1. This observation correlates well with our previous results<sup>2a</sup> concerning the synchronous type formation of the pyrazoline ring. Considering the <sup>3</sup>*J*(H-4',H- $\gamma$ ) ~ 9.5 Hz coupling constant in addition to the H-4'/H- $\delta$  NOESY proximity we can conclude that H-4' and H- $\gamma$  are antiperiplanar in the preferred conformation. As both H-2 geminal atoms strongly correlate with H- $\gamma$  in the NOESY spectrum the A  $\rightleftharpoons$  B

conformational equilibrium should be preferably shifted to the direction of B. A further evidence for this conformational preference can be concluded from the value of  $J(\text{H-2a/C-8a}) = 3.4$  Hz and  $J(\text{H-2b/C-8a}) = 5.7$  Hz couplings in compound **16** detected by  $J$ -HMBC measurements. Similar coupling constants (5.4 and 3.9 Hz) were measured for the thio analogue **19**.

Formation of one product was observed also for compounds **22** and **23** with  $\text{R}^1 = \text{Ph}$ . This can be explained well with the one-step character of diazomethane cycloaddition: in the transition state leading to **22** and **23** the diazomethane can link to the sterically non-hindered side (opposite to 2-phenyl)<sup>2a</sup> affording the structures shown by Scheme 3 and Figure 2. The configuration of C-4' was determined by H-2/H- $\gamma$  NOESY proximity.

### Scheme 3

For the determination of the configuration at C-2 and investigation of the  $\text{A} \rightleftharpoons \text{B}$  conformational equilibrium, the detected H-4'/H-2<sup>+</sup>,6<sup>+</sup> NOESY correlation was decisive. These hydrogen atoms can occur in steric proximity (ca. 3.4 Å) only in the "B" conformer shown in Figure 2.

**Figure 2.** Stereostructure (Hyperchem 7, semiempirical, PM3)<sup>8</sup> of compound **22**.

The  $^3J(\text{H-4}',\text{H-}\gamma) \sim 9.7$  Hz coupling and the H-4'/H- $\delta$  NOESY cross-peak corroborate the antiperiplanar arrangement of H-4' and H- $\gamma$  atoms in the preferred conformation. In conformer "B" H- $\gamma$  and H- $\delta$  atoms are located above the plane of 2-phenyl group and due to its shielding the chemical shifts of these hydrogen atoms are ca. 0.3-0.5 ppm lower than those in compound **16**.

## Conclusions

First synthesis of hitherto unknown group of 4'-styryl-spiro-1-pyrazolines has been achieved by the reaction of exocyclic  $\alpha,\beta,\gamma,\delta$ -unsaturated ketones with diazomethane. This reaction proved to be regioselective and stereospecific as in the case of the related exocyclic  $\alpha,\beta$ -unsaturated ketones. Stereospecific formation of these 1-pyrazolines is based on a one-step 1,3-dipolar cycloaddition of the diazomethane on the less hindered side of the  $\alpha,\beta$ -double bond of the unsaturated ketones.

## Experimental Section

**General.** Melting points were determined on a *Kofler* hot-stage apparatus and are uncorrected.  $^1\text{H}$ - and  $^{13}\text{C}$ -NMR spectra were recorded in  $\text{CDCl}_3$  at room temperature with a Bruker Avance DRX-500. Chemical shifts are given on the  $\delta$ -scale and were referenced to the solvents ( $\delta_{\text{C}} = 77.05$  and  $\delta_{\text{H}} = 7.27$ ). For the  $^1\text{H}$  and  $^{13}\text{C}$  signal assignments  $^1\text{H}$ ,  $^{13}\text{C}$ , DEPT-135, APT and two-dimensional gradient selected  $^1\text{H}/^1\text{H}$ -COSY,  $^1\text{H}/^1\text{H}$ -NOESY,  $^1\text{H}/^{13}\text{C}$ -HSQC,  $^1\text{H}/^{13}\text{C}$ -HMQC,  $^1\text{H}/^{13}\text{C}$ -HMBC and  $^1\text{H}/^{13}\text{C}$ -J-HMBC spectra were measured. In the case of overlapping  $^1\text{H}$  signals, the appropriate chemical shifts were determined utilizing the  $^1\text{H}/^{13}\text{C}$ -HSQC or  $^1\text{H}/^1\text{H}$ -COSY spectra. Regarding the monosubstituted phenyl groups (AA'MM'X spin system) simple first-order approximation was applied. The pulse programs of all experiments were taken from the Bruker software library. The IR spectra were obtained with a Perkin-Elmer 16 PC instrument. Mass spectra (CI) were recorded on a VG trio-2 apparatus. Elemental analyses (C,H,N) were measured in-house with a Carlo Erba 1106 instrument. TLC was performed on Kieselgel 60 F<sub>254</sub> (Merck) layer using toluene:ethyl acetate (4:1, v/v) as eluent.

### General procedure for the synthesis of exocyclic $\alpha,\beta,\gamma,\delta$ -unsaturated ketones **8-15**

A mixture of chromanone (**1**), 1-thiochromanone (**2**), flavanone (**3**) or 1-thioflavanone (**4**) (10.0 mmol), *trans*-cinnamaldehyde (**5-7**, 12.0 mmol), 10% potassium hydroxide (20 mL) and ethanol (60 mL) was stirred at room temperature for 3 h, then poured onto crushed ice. The precipitate was separated by filtration, washed free of base, and recrystallized from methanol to obtain compounds **8-15** (Scheme 1).

### General method for the preparation of spiro-1-pyrazolines 16-23

A mixture of the appropriate  $\alpha,\beta,\gamma,\delta$ -unsaturated ketone (**8-15**, 10.0 mmol), diazomethane (40.0 mmol, generated *in situ* by the reaction of N-nitroso-N-methylurea with potassium hydroxide), anhydrous diethyl ether (100 mL) and anhydrous methylenechloride (50 mL) was left to stand in a refrigerator (approx. 4 °C) for 48 h, then the solvent was evaporated under reduced pressure and the residue was crystallized from methanol to obtain spiro-1-pyrazolines **16-23** (Scheme 2).

#### 4'[(E)-2-Phenylethenyl]-4',5',2,4-tetrahydrospiro[1-benzopyran-3,3'-pyrazole]-4-one (**16**).
