Abstract

We report the chemical synthesis of a series of disaccharides of arabinofuranose with a glycosidic sulfur linker as mimics of the acceptor for arabinofuranosyltransferases with and without using any activator to avoid any complex reactions. These analogs were tested for *in vitro* activity against MTB strain H37Ra and 3 MAC clinical isolates. MICs were determined using a colorimetric microdilution broth assay. Bactericidal activity was studied with kill curves over a period of seven days. Intracellular activity against MTB H37Ra was determined in the Mono Mac 6 (MM6) human monocytic cell line.

Introduction

The resurgence of tuberculosis in developed nations as well as the appearance of multiple drug resistant forms of the disease throughout the world has raised the concern that this disease may resurface as serious public health problem¹⁻³ and this attracted renewed attention in identifying the potent antimycobacterial agents. Also, the effective chemotherapy of persons with AIDS who are infected with *Mycobacterium avium* can be difficult due to the inherent resistance of this organism.⁴ All *Mycobacterium* species share a characteristic cell wall, thicker than in many other bacteria, which is hydrophobic, waxy, and rich in mycolic acids/mycolates. The cell wall consists of the hydrophobic mycolate layer and a peptidoglycan layer held together by a

polysaccharide, arabinogalactan. The cell wall makes a substantial contribution to the hardness of this genus. The biosynthetic pathways of cell wall components are potential targets for new drugs for tuberculosis. Much of the pathogenicity of *M. tuberculosis* results from its unique and complex cell envelope. The major components of this mycobacterial envelope are the mycolyl arabinogalactanpeptidoglycan complexes (mAGPs) and the lipoarabinomannan (LAM)-associated lipoglycans. The biosynthetic pathways of cell wall components are potential targets for new drugs for tuberculosis. The recent advances in the characterization of mycobacteria cell walls have led to the identification of a vast array of highly unique biochemical targets that could lead to a new generation of potent and selective anti tubercular agents.⁵ Arabinogalactan, a major and essential component of the cell wall, is an attractive target for drug development as neither D-arabinofuranose nor D-galactofuranose, the monomers composing arabinogalactan, are found in mammalian cells.⁶ The effectiveness of antituberculosis drug, Ethambutol,⁷ which inhibits the synthesis of arabinan,⁸ a cell envelope component, illustrates the importance of this structure to the survival of the organism. Since several natural and synthetic arabinosyl glycosides are known to be substrate of mycobacterial arabinosyl transferase,⁹ we hypothesized that simple arabinosyl disaccharide incorporating a sulfur atom that could potentially chelate the putative cation might function as specific inhibitors.

The inhibitors of mycobacterial arabinofuranosyl transferases could be the ideal synthetic targets as neither D-arabinofuranose nor D-galactofuranose, the monomer composing arabinogalactan are found in mammalian cells. Recently, several oligosaccharides with sulfur in the glycosidic linkage are investigated as potential inhibitors of glycosyltransferases. Such compounds should also reduce hydrophilicity and enhance hydrolytic and enzymatic stability. We have initiated a program to synthesize a series of disaccharides with sulfur linkers as mimics of the acceptor for arabinofuranosyl transferase. Such compounds should also reduce hydrophilicity and enhance hydrolytic and enzymatic stability.

Herein we report for the first time the synthesis, characterization and biological evaluation of several regioselectively protected D-arabinofuranosyl-(1,5)-D-arabinofuranosides with thio-linked octyl groups. An octyl group has been shown to be suitable for studies of mycobacterial arabinosyltransferases and other glycosyltransferases.^{6b,7b,9b,10}

Results and Discussion

Thio-linked oligosaccharides involving hexoses have been synthesized earlier by a variety of procedures, (a) a S_N2 type reaction involving the reaction of a thiolate anion on a glycosyl halide,¹¹ and (b) the displacement of a leaving group by a 1-thioglycose.¹² Initially our approach was based on the former procedure to yield thio-linked arabinofuranoside, **9a**, **b**, **c** but the latter procedure was applied in a modified displacement reaction for the synthesis of the rest of the disaccharides to avoid using the toxic mercury salts as an activator and also to avoid any complex side reactions. An attempt was also made to couple the 2,3,5-tri-*O*-benzoyl arabino-

furanosyl trichloroacetimidate¹³ with octyl-2,3-di-*O*-acetyl-5-thio- α -D-arabinofuranoside¹³ using the promoters BF_3OEt_2 or TESOTf ¹⁴ which resulted in an inseparable mixture of symmetric α ,1-1, *O*-linked arabinofuranoside from donor, disulfide from acceptor and traces of the desired disaccharide (Scheme 1).

Scheme 1. Attempted synthesis of thio-linked disaccharides.

The octyl (**3a**), 1-methylpropyl (*sec*-butyl) (**3b**) and 3-phenylpropyl (**3c**) arabinosides were obtained separately from methyl-2,3,5-tri-*O*-benzoyl- α -D-arabinofuranoside¹⁵ (**1**) through the glycosyl bromide (**2**)¹⁶ with SnCl_4 ¹⁷ (Scheme 2). Another two-step protection/deprotection sequence yielded **6** which on reaction with potassium thioacetate gave **7**. Compound **7** upon treatment with sodium methoxide and coupling with **2** using mercuric cyanide as an activator afforded **8** in good yield. The target compounds **9a-c** were obtained after debenzoylation of **8**.

Compound **10** was obtained on treating **1**¹⁵ with thioacetic acid in boron trifluoride etherate which upon reaction with sodium methoxide gave **11** (Scheme 3). The coupling of **11** and **12** (obtained from **6a** on refluxing with sodium iodide in 2-butanone) on displacing the iodide of **12** without using any activator and followed by acetylation did not yield the expected α -linked thio disaccharide but β -linked arap(S,1-5) araf (**13**) and araf(S,1-5) araf (**14**).

To obtain the desired α -linked disaccharide, compound **18** synthesized from **1**¹⁵ after three steps of protection/deprotection techniques, on coupling with tosyl derivative (**6a**) yielded only the α -linked thiodisaccharide **19** (Scheme 4).

Similarly, the α -linked thiodisaccharide **26** was made from **15**¹⁸ as follows. Compound **15**¹⁸ upon methylation gave **20** followed by acetolysis with thiol acetic acid yielded β and α thioacetates **21** and **22**, respectively. After chromatographic separation, both the thiosodium derivatives **23** and **24** were reacted separately with **6a**, in absence of any activator, gave only α -linked thio disaccharide **25** irrespective of the anomeric configuration of starting thioacetates **21** and **22**, which on deacetylation gave **26** (Scheme 5).

Compound **34** was obtained from **15**¹⁸ on making the 5-*O*-TBDPS-derivative¹⁹ (**27**) followed by alkylation to get 2,3-di-*O*-methoxybenzyl, **28**, which upon desilylation (**29**), benzylation (**30**), demethoxybenzylation (**31**) and acetylation gave **32**. Compound **32** on reaction with thioacetic acid in boron trifluoride etherate yielded α -thioacetate **33** which ultimately gave the thiosodium **34** with sodium methoxide. Compound **34** was condensed with **6a** followed by acetylation resulted in thiodisaccharides **35** and **36** (Scheme 6).

Likewise, 5-deoxyarabinose **39** was obtained from **15**¹⁸ on tosylation (**37**), reduction with lithium aluminium hydride (**38**), and acetylation. Compound **39** was converted into α -thioacetate **40** as reported earlier and coupled with **6a** through **41** to give 5'-deoxythiodisaccharides **42** and **43** on acetylating the residue (Scheme 7).

Scheme 7. Synthesis of the thio-linked disaccharides **42** and **43**.

Compound **37** was refluxed with sodium azide to yield **44** which upon acetylation gave **45**. The α -thioacetate **46** was obtained from **45** with thiol acetic acid which ultimately yielded **47** with sodium methoxide. The coupling of **47** and **6a** gave the expected disaccharides **48** and **49** as octylglycosides after acetylating the residue. The deacetylation of isolated α - and β -linked thiodisaccharides **48** and **49** yielded **50** and **51** respectively. Compound **49** upon treatment with triphenylphosphine in water followed by deacetylation gave 5'-acetamidothiodisaccharide **52** (Scheme 8).

Compound **9** was active against *M. tuberculosis* with an MIC that was comparable to that observed with ethambutol. However, the thio-linked arabinofuranosyl disaccharide derivatives examined in this study tended to be less active against *M. avium*. Compound **9** was also bactericidal for *M. tuberculosis* and showed significant intracellular activity in a human macrophage cell line. However, the concentration of **9** that was active intracellularly also lowered the viability of the infected macrophages by 39%. The possible contribution of this loss of macrophage viability to the decrease in viability of the intracellular *M. tuberculosis* is unclear. We have observed that when there is significant decrease in macrophage viability, *M. tuberculosis* viability can also be affected. Therefore, the CFU reduction may not have been due to the drug alone.

Experimental Section

General. The general procedures were same as reported earlier.²⁰ The solvent used in NMR is CDCl₃ unless otherwise stated. The structures of disaccharides were assigned on the basis of decoupling experiments in ¹H NMR.

Octyl- α -D-arabinofuranoside (4a). To a solution of **2**¹⁶ (19.0 g, 36.1 mM) obtained from **1**¹⁵, in CH₃CN (600 mL) was added *n*-octanol (10 mL, 63.5 mM) and SnCl₄ (10 mL, 85.5 mM). The reaction mixture was stirred under argon at room temp. After 15h the reaction mixture was diluted with sat NaHCO₃ (127 mL) and filtered through a celite pad. To the filtrate was added CHCl₃ (260 mL) and water (260 mL). The aqueous layer was extracted thrice with CHCl₃. The combined organic layers were washed with aq. NaHCO₃, water, dried (MgSO₄), filtered, and concentrated under reduced pressure to give crude yellow oil. Purification through a short column of silica gel (cyclohexane : EtOAc, 4 : 1) gave **3a** (14 g) as a yellow oil.

A solution of **3a** (4.69 g, 8.17 mM) in dry MeOH (36 mL) was treated with methanolic ammonia (7N, 36 mL) under an atmosphere of argon. After 22 h at room temp the reaction mixture was concentrated under reduced pressure followed by column chromatography (CHCl₃ : MeOH, 9.5 : 0.5) gave **4a**, (5.30 g, 56 % for the last two steps). FAB-MS : *m/z* 263(M+H)⁺. ¹HNMR : δ 5.01 (1H, s, H-1), 4.16 (1H, dd, *J* 4.2, 1.9 Hz, H-4), 4.01 (2H, m, H-2, H-3), 3.89 (1H, dd, *J* 11.8, 2.4 Hz, H-5a), 3.82 (1H, dd, *J* 11.8, 1.76 Hz, H-5b), 3.71 (1H, m, OCHH-(CH₂)₆CH₃), 3.44 (1H, m, OCHH-(CH₂)₆CH₃), 1.59 (2H, m, OCHH-CH₂(CH₂)₅CH₃), 1.27 (10H, m, OCHH-CH₂(CH₂)₅CH₃), 0.88 (3H, t, *J* 7.0 Hz, OCHH-CH₂(CH₂)₅CH₃).

Octyl-5-*O*-*p*-toluenesulfonyl- α -D-arabinofuranoside (5a). Compound **4a** (6.39 g, 24.4 mM) in anhydrous pyridine (30 mL) was cooled to 0 °C and added drop wise a solution of *p*-toluenesulphonyl chloride (5.11 g, 26.8 mM). After 24 h at room temperature, the mixture was poured into ice water (83 mL), and extracted twice with CH₂Cl₂. The combined organic layers were washed successively with 1N HCl, aq. NaHCO₃, water, dried (MgSO₄), filtered, and concentrated to give crude yellow oil. Purification by silica gel chromatography (cyclohexane :

EtOAc, 1 : 1) gave **5a** (5.72 g, 57%) as a clear oil. FAB-MS m/z 417 (M+H)⁺. ¹H NMR : δ 7.78 (2H, d, J 8.1 Hz, ArH, ortho), 7.50 (2H, d, J 8.5 Hz, ArH, meta), 5.42 (1H, d, J 5.3 Hz, 2-OH), 5.32 (1H, d, J 5.3 Hz, 3-OH), 4.64 (1H, d, J 0.8 Hz, H-1), 4.14 (1H, dd, J 11.0, 2.6 Hz, H-5a), 4.02 (1H, dd, J 11.0, 6.6 Hz, H-5b), 3.80 (1H, m, H-3), 3.72 (1H, m, H-2), 3.58 (1H, m, H-4), 3.48 (1H, m, -OCHH(CH₂)₆CH₃), 3.40 (s, 3H, ArCH₃), 3.25 (1H, m, -OCHH(CH₂)₆CH₃), 1.49 (2H, m, -OCH₂CH₂(CH₂)₅CH₃), 1.26 (10H, m, -OCH₂CH₂(CH₂)₅CH₃), 0.85 (3H, t, J 7.0 Hz, -OCH₂CH₂(CH₂)₅CH₃).

Octyl-2,3-di-O-acetyl-5-O-p-toluenesulfonyl- α -D-arabinofuranoside (6a). To an ice cold solution of **5a** (4.93 g, 11.85 mM) in pyridine (21 mL) was added drop wise Ac₂O (15.2 mL) and allowed to equilibrate to room temp. Usual work up and purification by silica gel chromatography (cyclohexane : EtOAc, 4 : 1) gave 4.0 g (68%) of **6a** as a clear oil. FAB-MS m/z 501 (M+H)⁺; ¹H NMR : δ 7.80 (2H, d, J 8.3 Hz, ArH, ortho), 7.35 (2H, d, J 8.5 Hz, ArH, meta), 5.03 (1H, d, J 1.3 Hz, H-2), 4.96 (1H, s, H-1), 4.85 (1H, dd, J 4.8, 1.0 Hz, H-3), 4.27 (2H, m, H-5a,b), 4.15 (1H, m, H-4), 3.62 (1H, m, -OCHH(CH₂)₆CH₃), 3.40 (1H, m, -OCHH(CH₂)₆CH₃), 2.45 (s, 3H, ArCH₃), 2.07, 2.06 (3H each, s, 2 \times OAc), 1.56 (2H, m, -OCH₂CH₂(CH₂)₅CH₃), 1.27 (10H, m, -OCH₂CH₂(CH₂)₅CH₃), 0.87 (3H, t, J 7.0 Hz, -OCH₂CH₂(CH₂)₅CH₃).

Octyl-2,3-di-O-acetyl-5-deoxy-5-S-acetyl-5-thio- α -D-arabinofuranoside (7a). To a solution of **6a** (1.02 g, 2.04 mM) in DMF (4 mL) was added potassium thioacetate (0.60 g, 5.26 mM) under an atmosphere of argon. After 26 h at room temperature, the reaction mixture was diluted with ether (40 mL). The aqueous phase was extracted with ether and the combined organic layers were washed with water, dried (Na₂SO₄), filtered, and concentrated to give crude orange oil. Purification by silica gel chromatography (cyclohexane : EtOAc, 4 : 1) gave 0.719 g (88%) of **7a** as a yellow oil. FAB-MS m/z 405 (M+H)⁺; ¹H NMR : δ 5.03 (1H, d, J 1.9 Hz, H-2), 4.96 (1H, bs, H-1), 4.89 (1H, dd, J 5.7, 1.9 Hz, H-3), 4.16 (1H, m, H-4), 3.65 (1H, m, -OCHH(CH₂)₆CH₃), 3.40 (2H, m, H-5a, -OCHH(CH₂)₆CH₃), 3.17 (1H, dd, J 15.8, 6.8 Hz, H-5b), 2.36 (s, 3H, -SAC), 2.109, 2.101 (3H, s, 2 \times OAc), 1.56 (2H, m, -OCH₂CH₂(CH₂)₅CH₃), 1.27 (10H, m, -OCH₂CH₂(CH₂)₅CH₃), 0.88 (3H, t, J 6.4 Hz, -OCH₂CH₂(CH₂)₅CH₃).

Octyl-5-deoxy-5-S-(2,3,5-tri-O-benzoyl- α -D-arabinofuranosyl)-5-thio- α -D-arabinofuranoside (8a). To a solution of **7a** (1.14 g, 2.8 mM) in dry MeOH (24 mL), cooled to -40°C, was added a solution of sodium metal (65 mg) in dry MeOH (20 mL). The mixture was stirred for 1 h at -40 °C, and then for 30 min at 0 °C, the course of the reaction being monitored by T.L.C. The solvent was removed by passing argon into the mixture. To the residue was added dry benzene (34mL) and nitromethane (34 mL). The volume was reduced by half under reduced pressure. Then a solution of **2** (2.27 g, 4.3 mM) in benzene (5 mL) and nitromethane (5mL) was added, followed by Hg(CN)₂ (1.08 g, 4.3 mM) and 4 Å⁰ molecular sieves. The cloudy white reaction mixture was stirred for 40 h at 65 °C, under an atmosphere of argon, with exclusion of moisture and light. The reaction mixture was allowed to cool, diluted with CHCl₃ (24mL), and filtered through a bed of celite. The filtrate was washed with water, aq. NaHCO₃, aq. NaCl, dried (MgSO₄), filtered, and concentrated to give crude yellow foam. Purification by silica gel chromatography (cyclohexane : EtOAc, 3 : 1) gave 0.28 g (15%) of **8a** as a yellow oil. FAB-MS

Octyl-5-deoxy-5-S-(α -D-arabinofuranosyl)-5-thio- α -D-arabinofuranoside (9a). To a solution of **8a** (0.18 g, 0.25 mM) in dry chloroform (2 mL) and dry methanol (1.5 mL) was added a solution of sodium metal (10 mg) in dry methanol (1 mL). The reaction mixture was stirred under an atmosphere of argon. After 36h at room temperature, the reaction mixture was diluted with water (6 mL) and neutralized with Dowex-50W (50X8-400) cation exchange resin. The mixture was filtered through a cindered glass funnel and the filtrate partitioned between chloroform and water. The aqueous layer was washed with chloroform and then concentrated under reduced pressure. The white residue was purified by silica gel chromatography (CHCl₃ : MeOH, 9 : 1) to give 0.04 g (40%) of **9a** as a clear oil. 1-Methylpropyl-2,3,5-tri-O-benzoyl- α -D-arabinofuranoside (3b). To a solution of **2**¹⁶ (2.71 g, 5.17 mM) in CH₃CN (80 mL) was added n-octanol (0.81 mL, 8.9 mM) and SnCl₄ (1.38 mL, 11.8 mM) as done in **3a** to give an orange oil. Purification by silica gel chromatography (cyclohexane : EtOAc, 4 : 1) gave of **3b** as diastereomers (2.0 g, 75%) as a clear oil. FAB-MS m/z 525 (M+Li)⁺; ¹H NMR : δ 8.70 (15H, m, ArH), 5.58 (1H, bs, H-3), 5.48 (1H, bs, H-2), 5.40 (1H, bs, H-1), 4.87 (1H, m, H-5a), 4.67 (1H, m, H-5b), 4.57 (1H, m, H-4), 3.81 (1H, m, OCH(CH₃)CH₂CH₃), 1.58 (2H, m, OCH(CH₃)CH₂CH₃), 1.26 (3H, d, OCH(CH₃)CH₂CH₃), 0.88 (3H, t, J 6.8 Hz, OCH(CH₃)CH₂CH₃).

1-Methylpropyl- α -D-arabinofuranoside (4b). A solution of **3b** (3.29 g, 6.35 mM) in dry methanol (28 mL) was treated with methanolic ammonia (7N, 28 mL) under an atmosphere of argon as reported earlier in **4a** to give **4b** (1.3 g) as a yellow oil. The material was used directly in the next step.

1-Methylpropyl-5-O-*p*-toluenesulfonyl- α -D-arabinofuranoside (5b). Compound **4b** (1.3 g, 6.31 mM) in anhydrous pyridine (9.3 mL) was cooled to 0 °C and added drop wise a solution of *p*-toluenesulphonyl chloride (1.30 g, 6.82 mM) as mentioned earlier in **5a** to give a crude yellow oil. Purification by silica gel chromatography (cyclohexane : EtOAc, 1 : 1) gave **5b** as diastereomers (1.4 g, 62%) as a clear oil. FAB-MS m/z 361 (M+H)⁺. ¹H NMR : δ 7.80 (2H, d, J

1-Methylpropyl-5-deoxy-5-S-(2,3,5-tri-O-benzoyl- α -D-arabinofuranosyl)-5-thio- α -D-arabinofuranoside (8b). To a solution of **7b** (0.868 g, 2.49mM) in dry MeOH (18 mL), cooled to -40 °C, was added a solution of sodium metal (60 mg) in dry MeOH (18 mL). The mixture was stirred at -40 °C, and slowly allowed to equilibrate to room temperature. After 20 h the solvent was removed by passing argon into the mixture, and then carefully under reduced pressure. To the residue was added dry benzene (30 mL) and nitromethane (30mL). The volume was reduced by half under reduced pressure. Then a solution of **3** (2.09 g, .3.97 mM) in benzene / nitromethane (4.5 mL each) was added, followed by Hg(CN)₂ (1.0 g, 3.97 mM) and 4 Å⁰ molecular sieves as mentioned in **8a** to give a crude yellow oil. Purification by silica gel chromatography (cyclohexane : EtOAc, 3 : 1 to 100% EtOAc) gave 0.70 g (43%) of **8b** as a pale yellow oil (diastereomers). Octyl-2,3-di-O-acetyl-5-deoxy-5-iodo- α -D-arabinofuranoside (12). A solution of NaI (840 mg, 5.6 mM) and **6a** (400 mg, 0.8 mM) in 2-butanone (10 mL) was refluxed for 5 h. The reaction mixture was cooled to ambient temperature and filtered through a pad of celite. The filtrate was concentrated in reduced pressure and residue was partitioned between CH₂Cl₂ and water. The organic layer was washed with aq. Na₂S₂O₃ (0.1N), water, dried over Na₂SO₄, filtered and concentrated to give a clear oil. Column chromatography (cyclohexane : EtOAc, 9.5 : 0.5) of oil resulted in **12** (205 mg, 56%). FAB-MS *m/z* 463 (M+Li)⁺; ¹H NMR δ 5.09 (1H, d, *J* 1.3 Hz, H-2), 5.03 (1H, s, H-1), 4.87 (1H, dd, *J* 5.1, 1 Hz, H-3), 4.06 (1H, m, H-4), 3.68 (1H, m, -OCHH(CH₂)₆CH₃), 3.45 (3H, m, H-5a,b, -OCHH(CH₂)₆CH₃), 2.11 (6H, s, 2 \times OAc), 1.57 (2H, m, -OCH₂CH₂(CH₂)₅CH₃), 1.27 (10H, m, -OCH₂CH₂(CH₂)₅CH₃), 0.88 (3H, t, *J* 6.4 Hz, -OCH₂CH₂(CH₂)₅CH₃).

Octyl-2,3-di-O-acetyl-5-S-(2,3,4-tri-O-acetyl- β -D-arabinopyranosyl)-5-thio- α -D-arabinofuranoside (13) and Octyl-2,3-di-O-acetyl-5-S-(2,3,5-tri-O-acetyl- β -D-arabinofuranosyl)-5-thio- α -D-arabinofuranoside (14). To a solution of **10** (103 mg, 0.2 mM) in anhydrous MeOH (5 mL), freshly prepared solution of MeONa (1M, 0.2 mL) was added drop wise at -78 ^oC under argon. After 1h at room temperature, TLC confirmed the completion of the reaction. MeOH was evaporated off by gently passing the argon through the flask. The resulting residue **11** was dried overnight in vacuum pump.

The residue **11** and iodo sugar, **12** (76 mg, 0.16 mM) were dissolved separately in dry DMF (5mL each) and mixed together slowly at room temperature under the atmosphere of argon. The reaction mixture was stirred for 48 h at room temperature. DMF was evaporated off under reduced pressure. The residue was taken in CH₂Cl₂, washed with aq. NaHCO₃, water, dried over Na₂SO₄, filtered and concentrated to thick syrup. The syrup was acetylated with dry pyridine (3 mL) and Ac₂O (3 mL) followed by usual work up and column chromatography (cyclohexane : EtOAc, 9 : 1 to 8 : 2) gave **13** (30 mg, 25%) and **14** (20 mg, 16%).

Methyl-5-O-*p*-toluenesulfonyl- α -D-arabinofuranoside (37). To a dry pyridine (10 mL) containing **15**¹⁸ (1.5 g, 9.15 mM) was added dropwise a solution of *p*-toluenesulfonyl chloride (1.92 g, 10.06mM) in pyridine (10 mL) at 0 °C and the reaction mixture was stirred at room temperature overnight as mentioned earlier in **5** to give a crude pale oil. Purification by silica gel chromatography (CH₂Cl₂ : MeOH, 9.5 : 0.5 to 9 : 1) gave **37** (1.72 g, 59%) as a clear oil. Methyl-2,3-di-O-acetyl-5-deoxy- α -D-arabinofuranoside (39). Lithium aluminium hydride (160 mg, 4 mM) in ether (25 mL) was added drop wise to **37** (636 mg, 2 mM) in ether (75 mL) over 30 min at room temperature. The reaction was stirred at room temperature overnight followed by addition of EtOAc and water. The suspension was filtered through celite and the resulting filtrate was evaporated to dryness by coevaporating with pyridine thrice to give **38**. Acetylation of **38** with pyridine (5 mL) and Ac₂O (5 mL) followed by usual work up and column chromatography (cyclohexane : EtOAc, 8 : 2) yielded **39** (224 mg, 48%).
