Abstract

A highly convergent synthetic approach towards the macrolactone polyketide tianchimycin A is described. Notable features of our synthetic approach include highly stereoselective Myers alkylation, substrate controlled *anti* aldol reaction, and Masamune-Roush olefination.

Introduction

Actinobacteria are important sources of bioactive secondary metabolites.¹ In 2013, Deng and co-workers isolated two new 16-membered macrolactone type polyketides from the rare actinomycete *Saccharothrix xinjiangensis* B-24321 and named them as tianchimyacin A and tianchimyacin B (Figure 1).² Structures of tianchimyacins A-B were determined based on detailed NMR and MS spectroscopy. Architecturally tianchimyacin A is quite interesting. It is a macrocyclic lactone adorned with six stereogenic centers and three olefinic moieties. Out of three double bonds, two are part of 1,4-butadiene system and the third one is a part of α,β -unsaturated lactone moiety. Initial biological studies revealed that they do not have antibacterial activity. However modification of the structure might provide good antibacterial lead. Thus with this intention we initiated a program for the total synthesis of tianchimyacin A and its analogs to unveil the full biological potential. In 2015 Sabitha et al. reported the synthetic study of tianchimyacin A. They synthesized the entire acyclic C1-C16 framework of the molecule. However the macrolactonization under different conditions was unsuccessful.³ Thus we thought an alternate approach to construct **1** could be intramolecular Heck-cyclization for the formation of macrocyclic ring.⁴ Recently the employment of intramolecular Heck reaction for macrocyclization has flourished in natural product synthesis.^{4,16,17,18,19} It is interesting to note that this reaction is applicable to variation depending upon the macrocyclic ring size (16-24 size macrocycles), which requires optimization of variety of reaction parameters.

Results and Discussion

Retrosynthetically, we dissected **3** into building blocks **4** and **5** (Scheme 1). Heck coupling of substrate **3** was envisaged as a key step to close the macrocycle, while connection of the cyclization precursor **3** was planned to arise from Masamune-Roush olefination of aldehyde **4** and ketophosphonate **5**.^{5,6} The aldehyde **4** would be acquired from the known compound **7**⁷ using Myers asymmetric alkylation and the ketophosphonate **5** might be synthesized from known compound **9**⁸ using Paterson's *anti* aldol reaction.

Scheme 1. Retrosynthetic analysis of tianchimycin A.

From the synthetic perspective, synthesis of **4** (Scheme 2) began with the diastereoselective alkylation of the known iodide **7**⁷ with Myers pseudoephedrine derived auxiliary^{9,10} to yield amide **10** as a single diastereomer in 95% yield. Reduction of **10** with $\text{BH}_3 \cdot \text{NH}_3$ gave primary alcohol **6** in 90% yield. Compound **6** on oxidation under Dess-Martin Periodinane conditions provided an aldehyde, to which addition of (*Z*)-enolate, generated from **11**, using Crimmins's protocol¹¹ afforded **12** with excellent diastereoselectivity (98:2 dr), which are separated by standard silica gel column chromatography to obtain the required single isomer **12** in 96% yield. Reductive removal of the chiral auxiliary with LiBH_4 in ether furnished the 1,3-diol compound **13**, which on protection as PMP-acetal followed by TBDPS deprotection with TBAF gave a primary alcohol **15**. Oxidation of **15** with DMP gave an aldehyde which on reaction with vinylmagnesium bromide yielded diastereomerically mixture of alcohols **16**, which on TBS protection with TBSOTf in presence of 2,6-lutidine gave globally protected compound **17**. At this stage the *p*-methoxybenzylidene acetal of **17** was opened regioselectively with DIBAL-H to give a primary alcohol **4a**, which was oxidized with DMP to give required aldehyde **4** in 90% yield.

Synthesis of phosphonate fragment **5** commenced from known keto compound **9**⁸ (Scheme 3), which on reaction with acetaldehyde under Paterson's *anti*-aldol conditions^{12,13} using dicyclohexylborane chloride afforded β -keto alcohol **8**, in 96% yield with excellent diastereoselectivity which was protected as its TBS ether to give compound **18** in 92% yield. Reduction of the keto as well as benzoate group in **18** with LiBH₄ afforded diastereomerically mixture of diols **19** in 92% yield.⁷ Oxidative cleavage of the diol with NaIO₄ furnished an aldehyde, which on Takai olefination gave vinyl iodide **20** (*E*:*Z* ratio 19:1) in 80% yield over two steps.^{14,15} TBS deprotection from compound **20** furnished a secondary alcohol, which on acylation with diethyl phosphonoacetic acid under EDCI/DMAP conditions afforded the phosphonate **5** in 85% yield.

Having both the fragments in our hand, the Horner-Wadsworth-Emmons reaction⁵ under Masamune-Roush conditions was carried out between aldehyde **4** and the phosphonate **5** in presence of DBU and LiCl in acetonitrile to give key acyclic precursor **3** (Scheme 4) for intramolecular Heck-cyclization. At this stage the crucial intramolecular Heck-cyclization under assorted conditions (Table 1) was not successful leaving the total synthesis still elusive.^{4,16,17,18,19}

Conclusions

The synthesis of acyclic precursor of macrocyclic tianchimycin A was achieved by employing Myers asymmetric alkylation, Crimmins's aldol reaction, Paterson's aldol reaction, Takai olefination and Masamune-Roush olefination as key steps. Currently we are working to develop a diverse strategy to circumvent the problem of

macrocyclization, which might help us to achieve the total synthesis of tianchimycin A and its potential analogs and for biological screening, which will be reported in due course.

Experimental Section

General. All the reactions were performed in oven-dried glass apparatus under nitrogen or argon atmosphere under magnetic stirring. Standard methods were used to make anhydrous solvents. Unless otherwise noted, commercially available reagents were used without further purification. Glass columns packed with silica gel (60-120 or 100-200 mesh) were used for column chromatography. ^1H and ^{13}C NMR were recorded on 400 MHz, 500 MHz and 100MHz, 125 MHz spectrometer, respectively, in CDCl_3 solvent using TMS as an internal standard. Chemical shifts are measured as ppm values relative to internal CHCl_3 δ 7.26 or TMS δ 0.0 for ^1H NMR and CHCl_3 δ 77 for ^{13}C NMR. In ^1H NMR multiplicity defined as: s = singlet; d = doublet; t = triplet; q = quartet; dd = doublet of doublet; ddd = doublet of doublet of doublet; dt = doublet of triplet; m = multiplet; brs = broad singlet. Horiba sepa 300 polarimeter was used to record optical rotation using a 2 mL cell with a 10 mm path length. Alpha (Bruker) infrared spectrophotometer was used to record FTIR spectra. Either a TOF or a double focusing spectrometer was used to obtain high resolution mass spectra (HRMS) [ESI] $^+$.

(2S,4R)-5-(tert-Butyldiphenylsilyloxy)-N-((1R,2R)-1-hydroxy-1-phenylpropan-2-yl)-N,2,4-trimethylpentanamide (10). *n*-BuLi was added drop wise (29.18 mL of 2.5 M solution in hexanes, 72.96 mmol) to a stirred solution of flame dried LiCl (3.73 g, 91.2 mmol) and diisopropylamine (11.69 mL, 82.08 mmol) in THF (10 mL) at 0 °C, over 1 h. This mixture was stirred at 0 °C for an additional 15 min before being cooled to -78 °C. A solution of (1R, 2R)-(-)-pseudoephedrine propionamide (6.32 g, 38.30 mmol) in THF (20 mL) was then added to the reaction mixture very slowly using syringe pump. After being stirred at -78 °C for 30 min the reaction mixture was warmed to -20 °C and treated with a solution of the iodide **7** (2.0 g, 9.12 mmol) in THF (10 mL). The reaction mixture was stirred at -20 °C for 24 h and quenched with saturated aqueous solution of NH_4Cl (5 mL). The reaction mixture was extracted with EtOAc (2 x 20 mL). The combined organic extracts were washed with water (5 mL), brine (5 mL), dried over Na_2SO_4 , filtered and concentrated under vacuo. The residue was purified by column chromatography (SiO_2 , 25% EtOAc/hexane) to afford **10** (2.40 g, 95%) as a colorless liquid. (2S,4R)-5-(tert-Butyldiphenylsilyloxy)-2,4-dimethylpentan-1-ol (6). To a stirred solution of diisopropylamine (4.81 mL, 33.76 mmol) in THF (20 mL) at 0 °C was added *n*-BuLi (12.54 mL of 2.5 M solution in hexanes, 31.36 mmol) drop wise and the solution was stirred at 0 °C for an additional 15 min. Then Borane-ammonia complex (90%, 0.96 g, 31.36 mmol) was added to the solution. After stirring for 30 min at 0 °C, the solution was warmed to rt and stirred for additional 30 min. Then the reaction mixture was cooled to 0 °C and it was treated with a solution of amide **10** (2.1 g, 3.94 mmol) in 10 mL of THF. After stirring for 4 h at room temperature, the reaction mixture was quenched with saturated aqueous NH_4Cl (5 mL) solution and extracted with EtOAc (2x50 mL). The combined organic extracts were washed with brine (20 mL) and dried over Na_2SO_4 .

Evaporation of the solvent under reduced pressure gave crude mass which on purification via silica gel column chromatography (SiO₂, 17% EtOAc/hexanes) afforded **6** (980 mg, 90% yield) as a colourless viscous liquid. *R_f* 0.6 (25% EtOAc in hexanes); [α]_D²⁵ –2.04 (c 1.23, CHCl₃). (R)-4-Benzyl-3-((2R,3S,4S,6R)-7-(tert-butylidiphenylsilyloxy)-3-hydroxy-2,4,6-trimethylheptanoyl)oxazolidin-2-one (12). To a stirred solution of **6** (800 mg, 2.08 mmol) in CH₂Cl₂ (10 mL), NaHCO₃ (0.34 g, 4.16 mmol) was added at 0 °C, followed by Dess-Martin periodinane (1.32 g, 3.12 mmol) under nitrogen atmosphere and stirred for 2 h at room temperature. Saturated aqueous NaHCO₃ (5 mL) and Na₂S₂O₃ (7 mL) were added to the reaction mixture and extracted with EtOAc (2x10 mL). The organic phase was washed with water (10 mL), brine (10 mL), dried over Na₂SO₄ and concentrated in vacuo. The aldehyde, thus obtained, was used directly, for the next reaction without any further characterization.

TiCl₄ (2.4 mL, 2.32 mmol) was added to the compound **11** (0.53 g, 2.24 mmol) in dry CH₂Cl₂ (10 mL) at 0 °C and after 5 min, (-)-sparteine (1.23 mL, 5.3 mmol) was added. After stirring at the same temperature for 20 min, a solution of crude aldehyde in CH₂Cl₂ (5 mL) was added under nitrogen atmosphere. After 10 min the reaction mixture was quenched with saturated aqueous NH₄Cl solution (5 mL) and extracted with EtOAc (2 x 20 mL). The combined organic layers were washed with 0.5 N HCl (5 mL), water (5 mL), brine (5 mL), dried over Na₂SO₄ and concentrated in vacuo. To a stirred solution of primary alcohol (0.1 g, 0.22 mmol) in CH₂Cl₂ (3 mL), NaHCO₃ (0.37 mg, 0.44 mmol) was added at 0 °C, followed by Dess-Martin periodinane (0.18 mg, 0.44 mmol) under nitrogen atmosphere. The reaction mixture was allowed to attain room temperature and stirred for 2 h. Saturated Na₂S₂O₃ (10 mL) and NaHCO₃ (2 mL) were added to quench the reaction mixture. After stirring 15 min the reaction mixture was extracted with EtOAc (2 x 20mL). The organic phase was washed with water (20 mL), brine (20 mL), dried over Na₂SO₄ and concentrated in vacuo. The aldehyde **4** thus obtained was directly used, after passing through a short pad of silica, for the next reaction without any further characterization.

(2S, 4R, 5R)-5-Hydroxy-4-methyl-3-oxohexan-2-yl benzoate (8). To a stirred solution of *c*-Hex₂BCl (14.54 mL, 14.54 mmol) in Et₂O (20 mL) at -78 °C was added Me₂NEt (1.68 mL, 19.4 mmol), followed by ketone **9** (2 g, 9.7 mmol) in Et₂O (10 mL). The reaction mixture was warmed to -10 °C for first 30 min and then to 0 °C for next 1 h before being cooled to -78 °C. The commercially available acetaldehyde (2.70 mL, 48.48 mmol) was added and stirred for further 2 h at the same temperature. Then the reaction mixture temperature was raised to -20 °C and stirred for 14 h. The reaction was quenched at 0 °C by addition of MeOH (10 mL) and p^H 7 buffer (10 mL), H₂O₂ (5 mL, 30%) was then added and the stirring continued for 1 h and extracted with EtOAc (3x50mL).

The combined organic extracts were washed with water (10 mL), brine (5 mL) and dried over Na₂SO₄ and concentrated in vacuo. The residue was purified by column chromatography (SiO₂, 8% EtOAc/hexanes) to afford **8** (2.06 g, 96% yield) as a colourless solid. R_f 0.7 (20% EtOAc in hexanes); [α]_D²⁵ +30.0 (c 0.75, CHCl₃).

To a stirred solution of compound **5** (0.100 g, 0.22 mmol) and LiCl (0.02 g, 0.44 mmol) in MeCN (6 mL) at 0 °C, was added DBU (0.16 mL, 0.22 mmol) under argon atmosphere. After stirring at room temperature for 15 min, the mixture was again cooled to 0 °C. Then a solution of aldehyde **4** in MeCN (5 mL) was added dropwise. After stirring at room temperature for 12 h, the reaction mixture was quenched by addition of water and extracted with EtOAc (2 x 20 mL). The combined organic extracts were washed with brine (5 mL), dried over Na_2SO_4 , and concentrated under vacuo. Experimental procedure for the attempted Heck cyclization reaction (22)

1. To a stirred solution of **3** (0.02 g, 0.028 mmol) in DMF (5 mL) were added Cs_2CO_3 (0.016 g, 0.05 mmol), Et_3N (0.005 mL, 0.033 mmol) and $Pd(OAc)_2$ (0.01 g, 0.045 mmol) sequentially at rt under argon atmosphere. After stirring for 48 h at rt, the reaction mixture was quenched with water and extracted with EtOAc (2 x 10 mL). The organic phase was washed with brine (10 mL), dried over Na_2SO_4 and concentrated under vacuo.

2. To a stirred solution of **3** (0.02 g, 0.028 mmol) in MeCN (5 mL) was added Et_3N (0.03 mL, 0.221 mmol), followed by $PdCl_2(MeCN)_2$ (0.001 g, 0.46 mmol) and formic acid (0.001 mL, 0.027 mmol) at rt under argon atmosphere. After stirring for 1 h at rt, the reaction mixture was quenched by the addition of water (5 mL) and extracted with EtOAc (2 x 10 mL). The combined organic layers were washed with brine (5 mL) and dried over Na_2SO_4 and concentrated under vacuo.

3. To a stirred solution of **3** (0.02 g, 0.028 mmol) in DMF (5 mL) were added $Pd(OAc)_2$ (0.008 g, 0.035 mmol) and dry K_2CO_3 (0.032 g, 0.233 mmol) sequentially at rt under argon atmosphere. The resulting mixture was stirred at 80 °C for 2 h before being quenched by the addition of water (5 mL) and extracted with EtOAc (2 x 10 mL). The combined organic layers were washed with brine (5 mL) and dried over Na_2SO_4 . Evaporation of the solvent under reduced pressure gave crude mass.

4. To a stirred and degassed solution of **3** (0.02 g, 0.028 mmol) in DMF (5 mL) were added $Pd(OAc)_2$ (0.006 g, 0.028 mmol), dry K_2CO_3 (0.038 g, 0.28 mmol), and Bu_4NCl (0.023 g, 0.084 mmol) and the mixture was once again degassed. The solution was stirred under argon atmosphere and heated to 60 °C for 50 min. After cooling to room temperature, diethyl ether (5 mL) was added, and the solution was washed with water (5 mL) and extracted with EtOAc (2x10 mL). The combined organic extracts were washed with brine (5 mL) and dried over Na_2SO_4 and concentrated under vacuo.
