Abstract

A convenient route for the synthesis of bis-1,2,4-oxadiazoles is described. One-pot reaction of diazidoglyoxime esters and triphenylphosphine produced bis-1,2,4-oxadiazole derivatives in good overall yields by subsequent Staudinger/aza-Wittig reaction. All compounds were characterized by IR, ¹HNMR, ¹³CNMR and HRMS and the structure of key product was unequivocally confirmed by X-ray diffraction analysis.

Keywords: Bis-1,2,4-oxadiazoles; Staudinger reaction; Aza-Wittig reaction; Diazidoglyoxime esters

Introduction

Oxadiazoles and their derivatives are an important class of heterocyclic compounds and are widely used in medicine, pesticide chemistry and other fields as bioisosters of esters or amides. Oxadiazoles have been associated with a diverse range of pharmacological and biological activities, such as anticancer¹⁻⁴, antimicrobial⁶, antioxidant⁷, antibacterial activity⁸⁻¹¹, antiviral agents¹², antifungal agents¹³⁻¹⁴, HIV integrase inhibitors¹⁵.

There were many synthetic methods¹⁶⁻²⁰ of oxadiazole, but there were only few literatures on the synthesis of bisoxadiazole ring. diaminoglyoxime, as the only basic starting material, was used to obtain bis-1,2,4-oxadiazole derivatives through condensation and cyclization reaction with various reagents, such as triethyl orthoformate^{21,22}, triethyl orthoacetate²¹, trifluoroacetic acid²¹, trifluoroacetic anhydride²³ or acetoxyacyl chloride^{23,36} and chloroacyl chloride²⁴ in the existed literatures. A frequently applied strategy is to modify the substituents of bis-1,2,4-oxadiazole with nitrogenous groups to design metal complexes²¹ or energetic materials^{24,36}, but the substituents on the bis-1,2,4-oxadiazole ring are very limited. Study on the synthesis methodology of bis-1,2,4-oxadiazole curiously has been ignored. (Scheme 1)

a) The previous synthesis of bis-1,2,4-oxadiazole

b) This work:

Scheme 1. Approaches to bis-1,2,4-oxadiazole derivatives.

The Staudinger reaction²⁵ is between azides and triphenylphosphine (Ph_3P) to give iminophosphoranes ($\text{P}=\text{N}$).

The aza-Wittig reactions of iminophosphoranes with aldehydes, ketones and esters provide an important tool for the construction of $\text{C}=\text{N}$ double bond under mild and neutral conditions²⁵⁻²⁶. Especially the intramolecular version of the aza-Wittig reaction has been applied widely in the synthesis of nitrogen containing heterocyclic compounds²⁷⁻²⁸. In addition, Catalytic aza-Wittig reaction has also become a new method to construct some new heterocycles²⁹⁻³⁰. Recently we have been interested in the synthesis of various heterocycles via aza-Wittig reaction³¹⁻³⁵. In this work, we developed a new simple and efficient method for the synthesis of bis-1,2,4-oxadiazole derivatives from diazidoglyoxime esters via subsequent Staudinger and aza-Wittig reaction (Scheme 1).

Results and Discussion

Initially diazidoglyoxime **1** was obtained through the direct nucleophilic substitution reaction using dichloroglyoxime and sodium azide as the starting substrate in DMF, and the reaction was successfully carried out in high yield according to the literature³⁷. Diazidoglyoxime **1** is unstable and needs to be stored in a refrigerator at low temperature. And diazidoglyoxime **1** was treated with various aromatic acyl chlorides to obtain diazidoglyoxime esters **2a-2j** in high yield using dichloromethane as solvent in the ice-water bath. The reaction was promoted by using triethylamine as acid acceptor, the reaction was completed in about half an hour. (Scheme 2) Diazidoglyoxime esters **2** are also unstable because they contain an azide group. They should be reacted as soon as possible or stored at low temperature.

Scheme 2. Preparation methods of diazidoglyoxime esters **2a-2j**.

According to one literature procedure,³⁸ diazidoglyoxime **1** reacts with acetyl chloride to give 1,1'-diacetoxy-5,5'-tetrazole **5** instead of diazidoglyoxime ester **2k**. However, according to another new method provided in the literature, diazidoglyoxime ester **2k** was successfully obtained by reaction of diazidoglyoxime **1** and acetic anhydride. (Scheme 3)

Scheme 3. Preparation methods of diazidoglyoxime esters **2k**.

[a] Isolated yields.

Diazidoglyoxime esters **2** and triphenylphosphine underwent Staudinger reaction in anhydrous toluene at room temperature to give the key intermediate iminophosphanes **3**, which were not to be isolated. Subsequently the reaction system was heated at reflux (115 °C), and the bis-1,2,4-oxadiazoles **4a-4h** were obtained by intramolecular aza-Wittig reaction without catalyst.

With this information of these successful reactions in hand, we attempted to expand this methodology to the synthesis of bis-1,2,4-oxadiazoles with asymmetric substituent groups. When two different acyl chlorides were added to the reaction system in batches, the reaction was successful; diazidoglyoxime esters **2i** and **2j** with asymmetric substituent groups were obtained. Asymmetric bis-1,2,4-oxadiazoles **4i** and **4j** were successfully obtained by intramolecular aza-Wittig reaction when applying asymmetric diazidoglyoxime esters **2i** and **2j**.

Bis-1,2,4-oxadiazole **4a**, white crystals, was synthesized as the first example of this type of compound. The structure of **4a** was identified by IR, ¹H NMR, ¹³C NMR and HRMS. The IR of the reaction product showed aromatic C=N at 1608 cm⁻¹ and the characteristic peaks of benzene ring can also be found at the corresponding positions. The ¹H NMR showed it can be found the signal for the aromatic protons at δ 7.51–8.31 ppm. Furthermore, their structures were supported by ¹³C NMR. In addition, a single crystal of 5,5'-diphenyl-3,3'-bi(1,2,4-oxadiazole) **4a** was obtained from the CH₂Cl₂/petroleum ether solution of **4a**, and X-ray structure analysis verified the proposed structure (Figure 1). The preparation and characterization of other compounds **4b-4k** were described in detail in this paper. (Table 2)

Conclusions

In conclusion, we described a new efficient synthesis of fully substituted bis-1,2,4-oxadiazoles, which are of considerable interest as potential biological active compounds or functional explosive materials. This new procedure has the advantages of available starting material, simple operation, and mild reaction conditions.

Experimental Section

General. All reagents used in the reaction are commercial chemical pure or analytical pure; *N,N*-dimethylformamide (DMF) was dried with anhydrous magnesium sulfate for one week, triethylamine (Et₃N) was dried with calcium hydride and then distilled under atmospheric pressure, and toluene (C₆H₅CH₃) was dried with anhydrous calcium chloride for one week; Dichloroglyoxime, benzoyl chloride, sodium azide, triphenylphosphine, anhydrous sodium sulfate and the common solvents are commercially available analytical purity and can be used directly without purification.

All melting points were determined on a X-4 model melting point apparatus and were uncorrected previously. ¹H NMR and ¹³C NMR spectra were obtained with AVANCE NEO 500M spectrometer and resonances relative to TMS. Infrared spectra were recorded on a Perkin Elmer-Spectrum One spectrometer as KBr pellets and were reported in cm⁻¹. High-resolution mass spectra (HRMS) were recorded by an Agilent 6224 TOF LC/MS spectrometer. Silica gel (HSGF254) was used for TLC and Silica gel (200-300 mesh) was used for short column chromatography.

Synthesis of diazidoglyoxime. Sodium azide (1.26 g, 19.38 mmol) was added to a solution of dichloroglyoxime (1.5 g, 9.56 mmol) in DMF (20 mL). The reaction mixture was stirred at room temperature for 3 h and was then poured into 100 mL of cold water. The aqueous suspension was mixed continually for about 10 minutes until a large amount of white solid was precipitated from the solution. The crude product was collected by filtration and washed with petroleum ether and fully dried to yield diazidoglyoxime (1.44g, 89%) as white solid, mp 159 °C.

General procedure for synthesis of diazidoglyoxime esters (2a-2h, 2k). Diazidoglyoxime (0.51 g, 3mmol) was dissolved in anhydrous CH₂Cl₂ (10 mL) and aromatic acyl chlorides (6.3 mmol) were added. The reaction mixture was stirred in the ice-water bath for 5 minutes, a solution of redistilled triethylamine (0.67 g, 6.6 mmol) and CH₂Cl₂ (2 mL) was added drop wise into the system, and then after dropping the reaction system was stirred at room temperature for about 0.5-1 hours. When the starting materials were consumed, the mixture was poured into 100 mL of cold water and extracted three times with dichloromethane (20 mL×3), the extracted solution was washed once with saturated salt water. The combined organic layers were dried by Na₂SO₄, the solvent was evaporated under reduced pressure and the residue was purified by column chromatography (Petroleum ether/AcOEt v/v=7:1) to give diazidoglyoxime esters.

Compound **2a-2h** used in this study were prepared by the above procedure. Diazidoglyoxime ester **2k** was prepared by the previously reported method³⁸.

General procedure for synthesis of asymmetric diazidoglyoxime esters (2i, 2j). One of aromatic acyl chlorides (3 mmol) was added drop by drop to diazidoglyoxime (0.51 g, 3 mmol) in anhydrous CH₂Cl₂ (10 mL) at 0 °C, a solution of redistilled triethylamine (0.67 g, 6.6 mmol) and CH₂Cl₂ (2 mL) was added into the system drop by drop. When the aromatic acyl chloride was consumed, another aromatic acyl chloride(3 mmol) was added drop by drop to the reaction solution. When the depletion of the starting material diazidoglyoxime was observed by TLC, the mixture was poured into 100 mL of cold water, and extracted three times with dichloromethane (20 mL×3), the extracted solution was washed once with saturated salt water. The combined organic layers were dried by Na₂SO₄, the solvent was evaporated under reduced pressure and the residue was purified by column chromatography (Petroleum ether/AcOEt v/v=7:1) to give diazidoglyoxime esters **2i** or **2j**. The carbon spectra of diazidoglyoxime esters **2c**, **2f**, **2g**, **2i** and **2j** are missing due to poor solubility in the solvents deuterated chloroform, deuterated DMSO and deuterated DMF.

For C₁₆H₈F₂N₄O₂ [M+H]⁺:327.0693; found 327.0702.

5,5'-Bis(4-(oxo-16-methyl)phenyl)-3,3'-bi(1,2,4-oxadiazole) (4f). light yellow solid (yield 0.37g, 51%), mp 176-178°C; IR(KBr): 1686, 1606, 1585, 1519, 1430, 1302, 1260, 1168cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 8.07 (d, *J* 10.0 Hz, ArH, 4H), 6.99 (d, *J* 10.0 Hz, ArH, 4H), 3.90 (s, OCH₃, 6H); ¹³C NMR (125 MHz, CDCl₃) δ 171.4, 163.9, 132.3, 132.2, 132.1, 128.6, 121.8, 113.7, 55.5; HRMS(ESI) *m/z*: calcd. for:C₁₈H₁₄N₄O₄ [M+H]⁺: 351.1093; found 351.1098

5,5'-Bis(4-chlorophenyl)-3,3'-bi(1,2,4-oxadiazole) (4g). light yellow solid (yield 0.45g, 65%), mp 273-275°C; IR(KBr): 1610, 1580, 1558, 1478, 1426, 1311, 1273, 1229,1081cm⁻¹; ¹H NMR (500 MHz, DMSO) δ 8.26 (d, *J* 10.0 Hz, ArH, 4H), 7.79 (d, *J* 10.0 Hz, ArH, 4H); HRMS(ESI) *m/z*: calcd. for: C₁₆H₈Cl₂N₄O₂ [M+H]⁺:360.0102; found 360.0118.

5,5'-Bis(4-(trifluoromethyl)phenyl)-3,3'-bi(1,2,4-oxadiazole) (4h). light yellow solid (yield 0.46g, 58%) , m.p.253-255°C; IR(KBr): 1566, 1503, 1414, 1319, 1236, 1176, 1063, 1018cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 8.46 (d, *J* 5.0 Hz, ArH,4H), 7.89 (d, *J* 5.0 Hz, ArH, 4H).¹³C NMR (125 MHz, CDCl₃) δ 176.2, 160.7, 135.0, 129.0, 126.4, 123.3(*J*_{C-F} = 271.25 Hz); HRMS(ESI) *m/z*: calcd. for: C₁₈H₈F₆N₄O₂ [M+H]⁺: 427.0629; found 427.0621.

5-(4-Chlorophenyl)-5'-(4-fluorophenyl)-3,3'-bi(1,2,4-oxadiazole) (4i). light yellow solid (yield 0.36g, 52%) mp 255-256°C; IR(KBr): 1615, 1572, 1500, 1432, 1314, 1232, 1158, 1078cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 8.34-8.30 (m, ArH, 4H), 7.29 (d, *J* 10.0 Hz, ArH, 4H); ¹³C NMR (125 MHz, CDCl₃) δ 176.5, 166.0(*J*_{C-F} = 253.75 Hz), 160.7, 131.0 (*J*_{C-F} = 8.75 Hz), 119.6(*J*_{C-F} = 2.5 Hz), 116.8(*J*_{C-F} = 21.25 Hz); HRMS(ESI) *m/z*: calcd. for: C₁₆H₈ClFN₄O₂ [M+H]⁺: 343.0398; found 343. 0414.

5-(4-Bromophenyl)-5'-(p-tolyl)-3,3'-bi(1,2,4-oxadiazole) (4j). light yellow solid (yield 0.44g, 58%), mp 291-293°C; IR(KBr): 1601, 1554, 1477, 1420, 1402, 1304, 1277, 1233, 1069, 1012cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 8.17 (d, *J* 10.0 Hz, ArH, 4H), 7.75 (d, *J* 10.0 Hz, ArH, 4H), 2.48 (s, CH₃, 3H); HRMS(ESI) *m/z*: calcd. for: C₁₇H₁₁BrN₄O₂ [M+H]⁺: 384.2130; found 384.2092.

5,5'-Dimethyl-3,3'-bi(1,2,4-oxadiazole) (4k). White solid (yield 0.21g, 63%), mp 160-162°C; IR(KBr): 1692, 1614, 1570, 1501, 1439, 1355, 1117cm⁻¹; ¹H NMR (500 MHz, CDCl₃) δ 2.73 (s, CH₃, 6H). ¹³C NMR (125 MHz, CDCl₃) δ 178.4, 160.0, 12.4; HRMS(ESI) *m/z*: calcd. for: C₆H₆N₄O₂ [M+H]⁺: 167.0569; found 167.0560.

Acknowledgements

We gratefully acknowledge financial support of this work by the Natural Science Foundation of Shanxi Province (No. 201801D121036) and the key industrial R & D Foundation of Datong City in Shanxi Province (No. 2017012)

Supplementary Material

Crystal data, IR, ¹H, ¹³C spectra of the compounds prepared are available as supplementary material.
